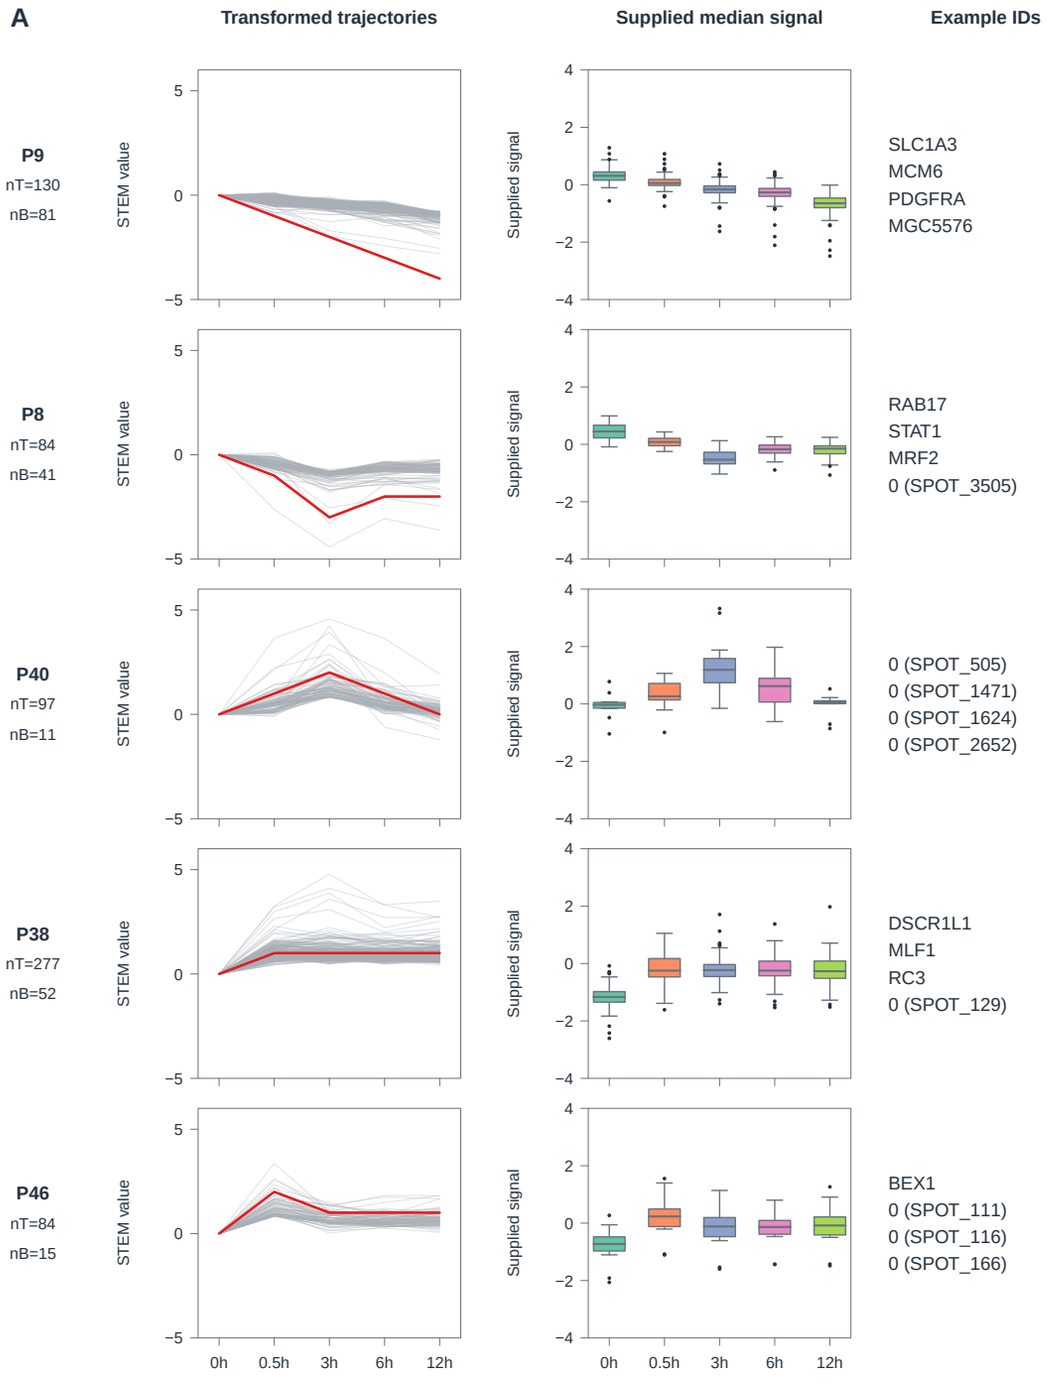
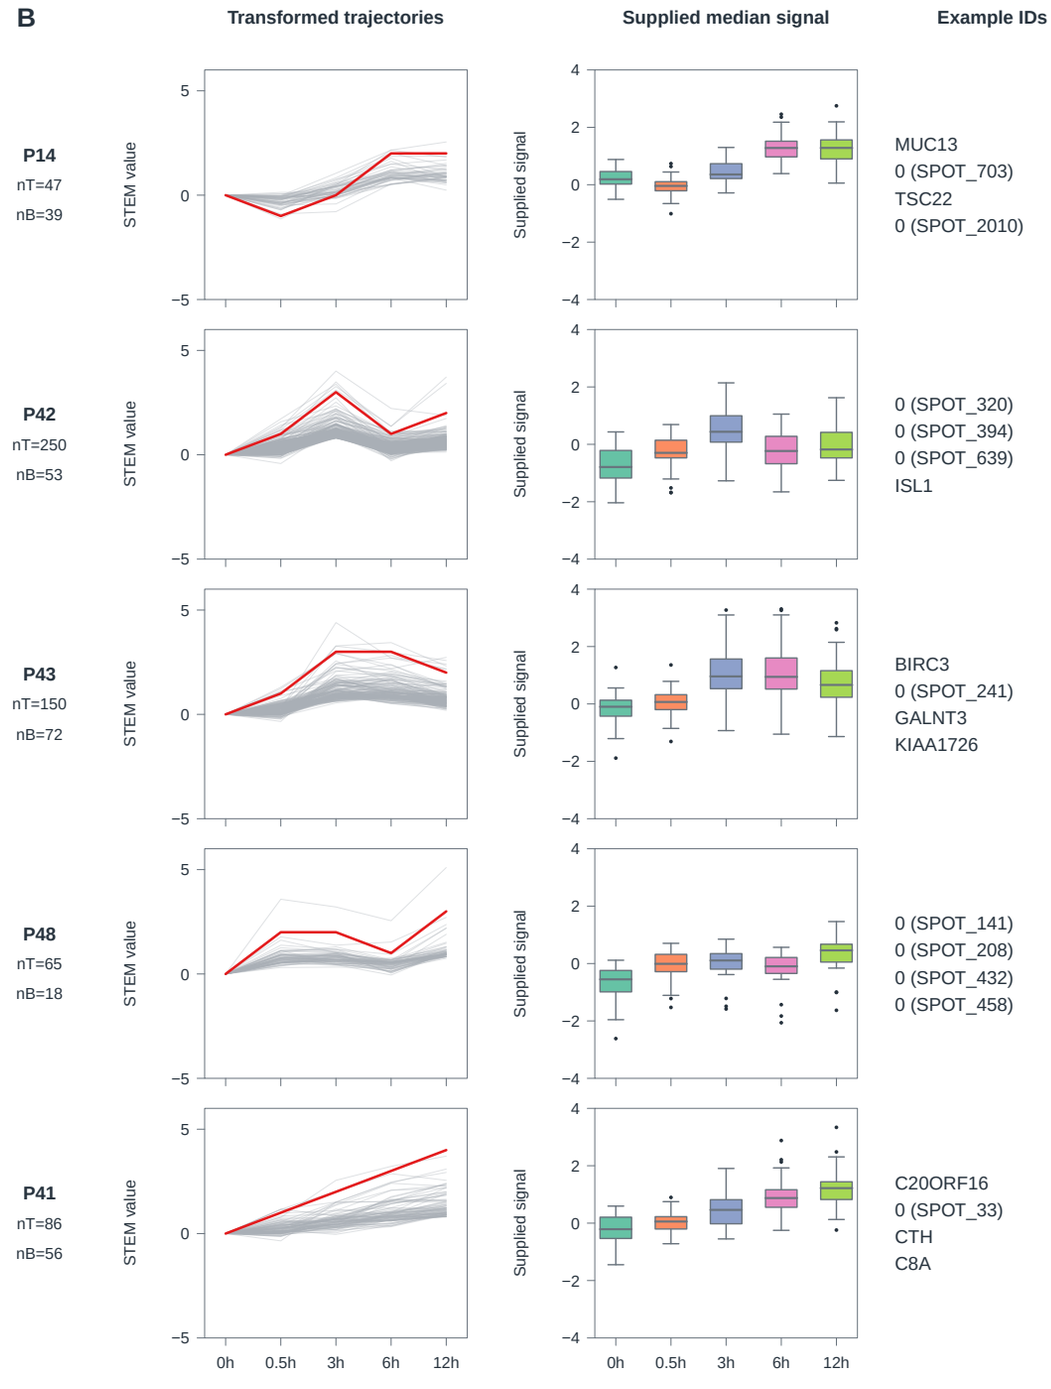
STEM profiles and supplied signal distributions

10 source−selected profiles; 1270 trajectory identifiers; 438 matched signal genes; no time−comparison tests





Red: STEM model (not a representative gene); gray: supplied transformed trajectories; time points are equally spaced categories.

Boxes: per−gene median across annotated spots and two supplied matrices; outliers shown; nT/nB count trajectory/signal genes, not independent replicates.

Exact Gene Symbol matching only; unmatched identifiers and missing measurements are exported. No time−comparison significance is asserted.
